Technology: PHP (Yii2), MySQL, JavaScript, MikroTik Libs, REST API

Auto Isolation System is an automated feature for home internet services that monitors customer billing status in real time. When a payment becomes overdue, the system instantly restricts or isolates the internet connection without manual intervention. This ensures efficient service management, reduces operational workload, and helps maintain consistent billing discipline.

cloudXchange Official Website

Technology: NextJS, Tailwind, PM2

Official Website cloudXchange serves as the main digital platform to showcase company information, services, technical information, ecosystem and contact details. It is designed to provide a professional online presence and make it easy for member and partners to explore and connect with cloudXchange.

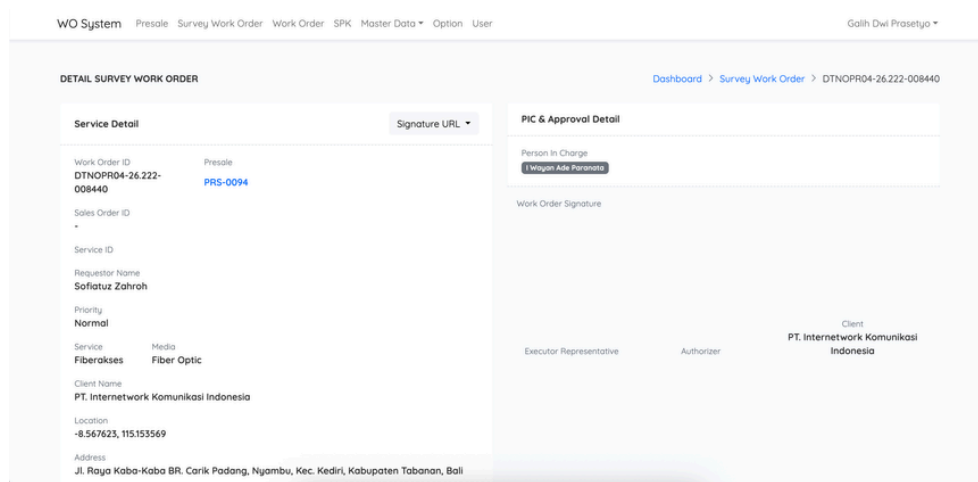

Homeaccess Internet

Technology: Svelte, Vite, Tailwind, Mapbox, Zoho, PM2, REST API

HomeAccess is a dedicated platform for both residential and business customers to request new internet installations. It simplifies the registration process, captures customer requirements, and enables faster, more efficient service activation through a user-friendly interface.

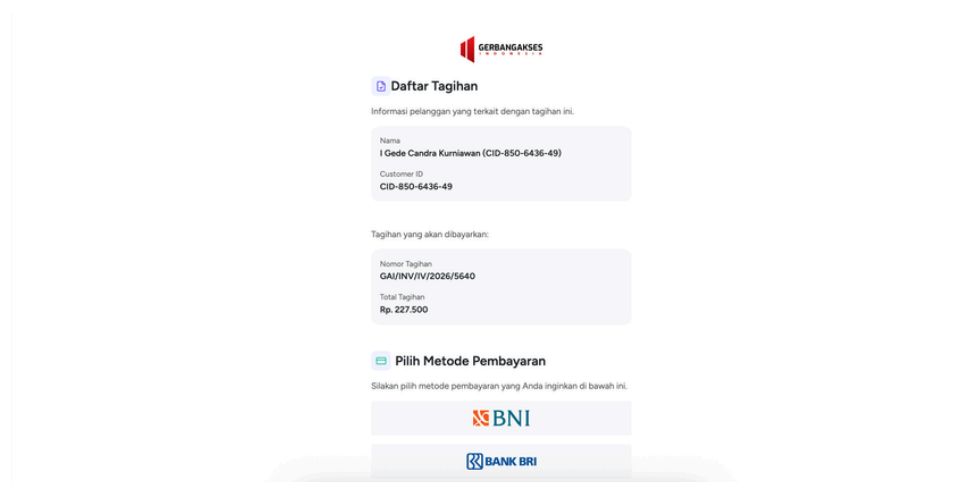

Work Order System

Technology: PHP (Yii2), MySQL, JavaScript, REST API

Work Order System is a tool to manage and track field operations for both residential and business services. It allows teams to survey, dismantle, and installation, maintenance, and troubleshooting tasks in real time ensuring faster execution, clear coordination, and improved service efficiency.

Billing Customer Payment

Technology: Svelte, Vite, Tailwind, Jurnal.id, Xendit, Golang, PM2, REST API

Payment page system, seamless payment processing through integrated payment gateways Xendit. It also connects with Jurnal.id for synchronized financial records, ensuring accurate billing, efficient payment tracking, and streamlined accounting operations.

Coverage Checker

Technology: PHP (Yii2), Mapbox, MySQL, JavaScript, REST API

smart tool that verifies whether a customer's location is covered by our network by analyzing the nearest road routes using map integration. It helps ensure accurate service availability checks and supports faster, more efficient installation planning.

Building Reliable Infrastructure

Successfully managed infrastructure consisting of **150+ virtual machines** and **10+ bare-metal** servers **across 5+ data centers**, ensuring high availability, disaster readiness, security, and operational excellence through automation and proactive monitoring.
